In an ever-connected world, quick access to information is always expected. For the U.S. military, this means ensuring personnel are able to upload and analyze aircraft data, order parts, communicate with each other, among other functions, within maintenance hangars and airports even in the most remote and austere
environments.

ID Technologies' Jeff Panebianco and CommScope's John McDonald discuss the technology behind connecting the nation's defense services to ensure maintenance and other aircraft personnel are achieving the Defense Department's mission efficiently and with cost savings.

This episode is sponsored by ID Technologies and CommScope.
